

BOOM TETHER DESCRIPTION

The **ELASTEC BOOM TETHER SYSTEM** is used for securing floating booms and barriers to a jetty or pier. The Tether can be attached to piles from of 12, 18, 24 and 36 inch diameter (30, 45, 60 and 90cm).

The Tether is made of hard rubber discs separated by floats threaded on a 5/16 inch Stainless Steel chain. The Tether attaches around a pile and allows the boom to move up and down with changing tides.

This method of securing booms underneath jetties prolongs the boom life by keeping it away from hard surfaces and in the proper deployment position.
