Filling level indicator FA5

for your heating oil tank

The FA 5 electronic filling level indicator determines the filling level in cm in the connected tank easily and conveniently by pressing a button.

- innovative technology
- simple installation
- attractive price

The tank design does not matter here – whether plastic or steel tank

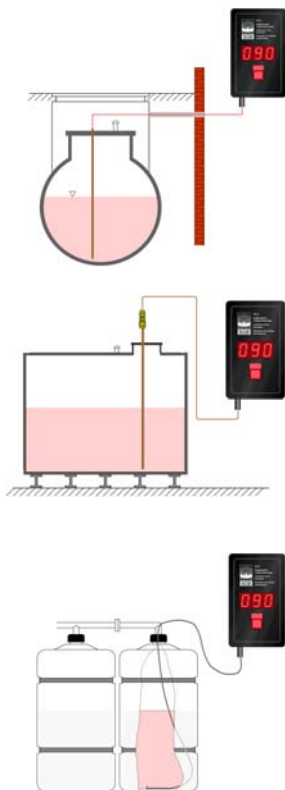

The filling level indicator is suitable for all tank designs up to 3.0 m diameter or tank height for the storage of heating oil or diesel.

No power socket and programming are necessary

Simply insert the copper tube into the tank through a small opening (5.5 mm) or let the measuring hose drop into the tank to its full length, push on the connection hose and start measuring.

Function:

Press the operating button once briefly and the current filling level in cm is displayed a few moments later. The filling level conversion to filling volume is made using the bearing chart for the tank. A bearing chart for cuboid tanks can be found at www.sgb.de.
